Abstract of FR 2606207 (A1)

The invention relates to an electronic filtering unit with capacitive elements. The unit comprises an electrically conducting plate 1 and a plurality of separate capacitive elements denoted Ei. Each element has a through hole denoted Oi forming first connection terminal Bi1 of the capacitive element Ei and is mounted in a mounting orifice denoted ORi of the plate 1. The second connection terminal Bi2 of each capacitive element Ei is electrically connected to the electrically conducting plate 1. Application to the filtering of the terminals of connectors, and to the construction of multiple feed-through filters.
